

Reprogramming a V-Ray dongle

To use this system, you must have the latest V-Ray License Server installed.

If you do not have the latest license server, please login to www.chaosgroup.com with your user name and password and download.

Windows operating system

1. Make sure the dongle is plugged in and the V-Ray license server is running
2. Open a web browser and type the following into the address bar:
<http://localhost:30304/goupgrade>
3. After the "Success" page appears, save the remote context file (context.wbc) by right-clicking on the link and selecting *save link as/save target as*
4. Send the context file to us via email at sales@digimation.com

Mac operating system

1. Stop V-Ray license server - if it is running you should see a V-Ray icon on your task bar. Right-click on the icon and choose "Exit". To make sure that the server is stopped, please check to see if a process named "vrlservice" is running using the Activity Monitor.app (in /Applications/Utilities/). If there is a filter selected, please change it to "All Processes" and search for "vrlservice". If you find it, end/stop the process.
2. Go to /Applications/Utilities/ and start Terminal.app.wkconf
3. Type the following command (you may simply copy & paste it into the Terminal):

```
/Applications/ChaosGroup/VRLService/snow_leopard_x86/bin/vrlservice.app/Contents/MacOS/vrlservice
```

this will start V-Ray license server in the Terminal.
4. Now open Safari and type the following into the address bar:
<http://localhost:30304/goupgrade>.
If it opens without errors, save the context.wbc file and then stop "vrlservice" by clicking CTRL+C in the Terminal window.
5. Send the context file to us via email at sales@digimation.com
